

INGOT MOULDS

AFS Sedan has more than **20 years of experience** in ingot mould production. Thanks to our know-how and our attention to detail during the production process, we produce **high quality ingot moulds**.

These ingot moulds are cast in lamellar graphite iron or in spheroidal graphite iron. Their function is to receive the liquid steel and to conserve it until solidification. We can also add alloying elements in order to improve the characteristics of the cast iron (on demand).

AFS Sedan produces ingots for forging and for rolling in **a large range of shapes and weights**:

- From 1 to 42 tons
- Square, polygonal, cylindrical, flat shapes...

We also supply ingot mould associated products such as bottom pouring plates, cover plates, raiser plate, pouring system, ...

A high quality ingot mould will have a **good longevity**. This longevity will depend on good design, good cast iron and good use of steelwork. Our **metallurgical control** provides you the best product.

Ingot mould for 40 tons forged ingot

Multi-sources base plate

Ingot mould for tube ingot

Ingot mould for 22 ton flattened ingot
